

Digifort Release Notes

Version 7.2.0.0

Index

Part I Description	5
Part II Version 7.2.0.0	7
1 New features and improvements.....	7
Support for H.265	7
Support for QuickSync	7
Thumbnail search in playback	7
Metadata recording	8
Motion detection and event information on timeline	11
Support to IPv6	12
Experimental 64bit	12
Support for SNMP	13
Exporting in JPEG	13
Exporting in MP4	14
Codecs for AVI exporting	15
Playback of archived media	16
Playback of cameras from Analytics and LPR objects	16
Alert e-mails with link to playback	18
Alert e-mails with embedded analytics metadata	20
Turbo exporting	22
Instant update on timeline move	22
Integration with Video Synopsis module	23
Printing playback images	23
Privacy Mask with blur	25
Easy registration of multi-channel devices	25
Image preview on camera registration	27
Customized positioning of alarm screens	28
Displaying the name of objects on virtual monitor	29
Status of objects in the list of virtual matrix monitors	30
Object selection on media player	30
Disable the use of keyboard controller for playback	31
Close minimized Surveillance Client	32
Activation or Deactivation of maps	32
Event action to activate objects	32
Changing connection data for multiple cameras	33
Automatic recording of metadata for analytics	34
Add multiple presets to patrol	34
Recorded days in system report	35
Remove multiple edge recording jobs from a camera	36
License expiration field	36
New LPR engine	37
New Surveillance Client restrictions	37
Event to cancel a timer	38
Surveillance Client operation buffer	39
New licenses summary screen	39
Verification of offline devices	40
Audio recording on motion detection	40
Pre-registered PTZ auxiliary	40

Improvements to RTSP Server	41
Improvements to recording and timeline reading	41
Better audio control in playback	41
Playback time in audit records	42
Better management of server connections in Surveillance Client	43
Failover operation option	43
Send multiple objects to Virtual Matrix	44
Media exporting with camera description	45
Improved accelerated playback	45
Recording error rearm time	45
I-Frame distance information	46
Master / Slave Admin password	46
Backup finished message	47
Organized disk charts	47
Better management of media profiles	48
Possibility to delete multiple objects	49
New snapshot formats	50
Ping test for I/O devices	50
Open field to type device model name	51
Edge recording download control	53
Searching for devices with IP Range	53
Better performance for objets list	54
Configuration data in registry (64bit)	54
New audio codecs	54
Improvements to database connection	55
Playback with DGF-KB1000 keyboard improved	55
Copy machine code to the clipboard	55
Timeline zoom animation	55
Improvements to ONVIF driver	56
Improvements to Axis PTZ driver	56
Digifort RTSP driver audio output	56
Barco video wall integration improvements	56
Quick Support	56
New features to Standard edition	56
2 New supported devices.....	56
Media Devices	56
I/O Devices	79
3 Fixes.....	79
Index	0

Part

1 Description

This file contains the history of all changes made to the system. Changes here shown are valid for the Enterprise edition that has all the features. Professional, Standard and Explorer editions may not have certain items described in this file.

Part

2 Version 7.2.0.0

Release date: January 12, 2017

2.1 New features and improvements

This section contains information about the new system features and improvements.

2.1.1 Support for H.265

Added full support for decoding and management of H.265 streams (HEVC)

H.265 is a major evolution of the H.264 codec, with gains of up to 50% less bandwidth for the same visual quality. The system now supports full compatibility with this new codec for selected cameras. The system RTSP server has also been prepared to provide H.265 stream if the camera is recording in this format.

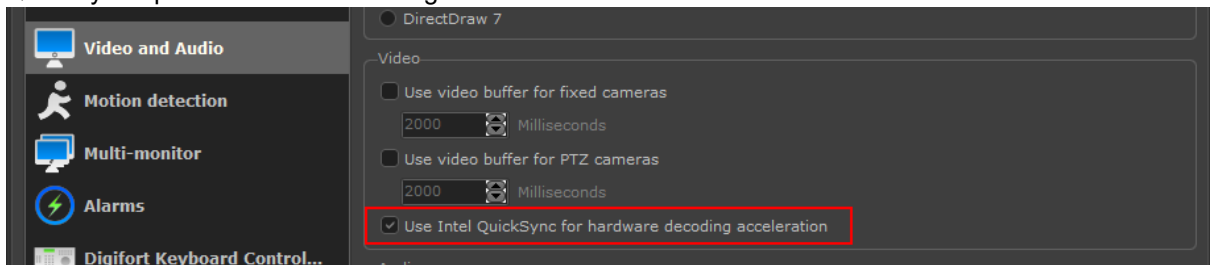

2.1.2 Support for QuickSync

Added support for video decoding (H.264 and H.265) using QuickSync via the Intel processor video card.

QuickSync is an Intel technology that enables video decoding through the graphics processor embedded in its processors. To use QuickSync your computer must support the use of the built-in video card (Intel HD Graphics) and it must be active in the operating system.

It is recommended to use QuickSync for viewing 5-megapixel or larger images, where hardware decoding gains are most notable. It is also recommended to use 64bit Surveillance Client because memory usage is higher.

QuickSync support has been added to the Surveillance Client and to use it, simply enable the QuickSync option in the client settings:

2.1.3 Thumbnail search in playback

Media Player now allows you to search for thumbnails. This great feature will display a thumbnail of different recording times, allowing you to quickly locate a desired scene.

It is possible to generate thumbnails based on a time slice where the system will display thumbnails with fixed time interval or per bookmark where the system will display a thumbnail for each camera bookmark. The system still allows for the custom choice of the time interval and the size / quantity of thumbnails on the screen. Clicking on a thumbnail will synchronize the video with the time of the thumbnail for quick viewing of the event.

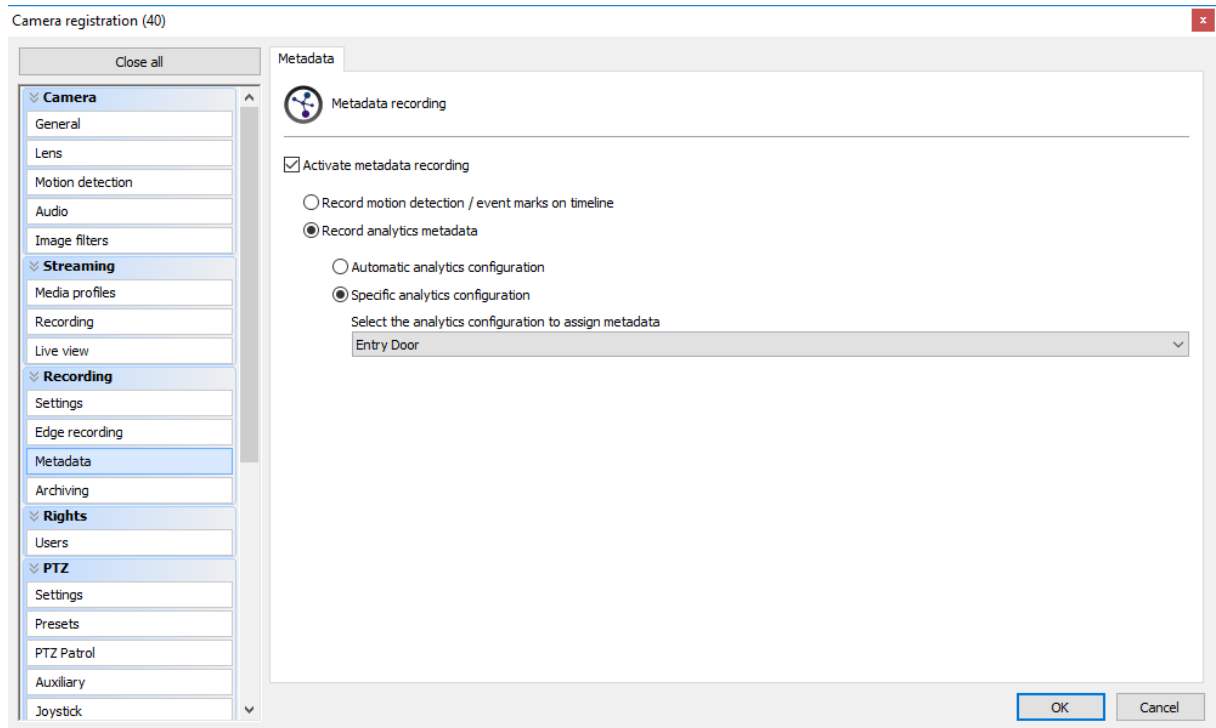

The system also allows you to search for thumbnails in exported videos using the native format.

2.1.4 Metadata recording

The system now allows metadata recording and playback tied to camera images. At this moment only analytics metadata are supported, but different types of metadata are planned for future implementation.

In Administration Client you can activate and deactivate the metadata recording and select its origin.

During media playback, all metadata associated to the camera will be rendered. A purple bar will be displayed in the timeline to show metadata recording track.

During media playback with metadata, the system allows the selection of which analytics metadata information will be displayed, such items can be disabled or enabled during playback.

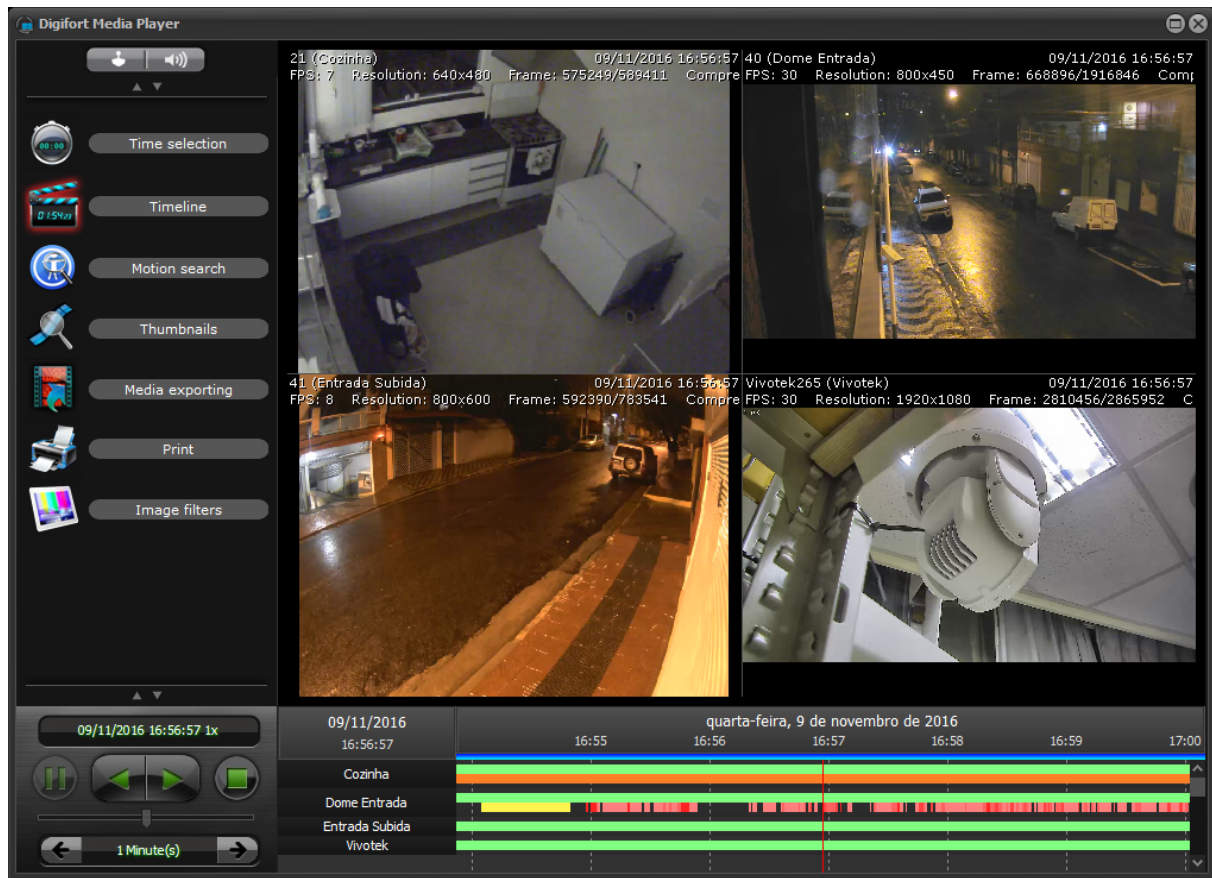

Metadata will also be included in exported media using native format.

If recording archiving is activated the metadata will also be archived, along with video and audio.

2.1.5 Motion detection and event information on timeline

The system now allows the recording of metadata with motion detection or event recording information. This feature allows easy identification, on the timeline, of movement or event recorded through a special line with colors identifying movement or event.

A period with a yellow band identifies an event in the recording while a period with a red band (with different intensities) identifies motion detected on the camera.

2.1.6 Support to IPv6

Added basic support to IPv6. It is now possible for the server to connect to cameras using IPv6 and clients accessing the server using IPv6 networks.

When using literal IPv6 addresses in the system, it has to be specified between square brackets ("[" e "]"). Example: [2001:db8:85a3:8d3:1319:8a2e:370]

The notation with brackets should be used both for server IP registration on the client as to the equipment register on the server. If the address is IPv4 literal or DNS, the address should not contain brackets.

Some features such as IP filtering and Multicast are not yet available in IPv6 but support for them will be added in future releases.

2.1.7 Experimental 64bit

It was included in this release the experimental 64bit version of the Server and Surveillance Client components that are the most critical in the system. The 64bit version will allow these components to use the entire available memory of the computer (Not restricted to 3.5GB as 32bits version), which should allow for better management of high-megapixel images.

By default, the 64bit version will not be available in Start Menu or Desktop. To run the Surveillance Client in 64bits it is required to execute the file `surveillance64.exe` directly, and to execute the server it is required to rename the file `server64.exe` to `server.exe` (and rename old `server.exe` to `server32.exe`), thus allowing the service manager to start the server.

Some features are still not available in the 64bits version, such as:

- Biometric authentication
- Remote keyboard control using Insight (Surveillance Client)
- Locking of surveillance station
- Integration with Digifort Evidence
- Dewarping of 360 degree images

2.1.8 Support for SNMP

The system now allows sending TRAPs to notify the occurrence of any system events through the SNMP protocol.

2.1.9 Exporting in JPEG

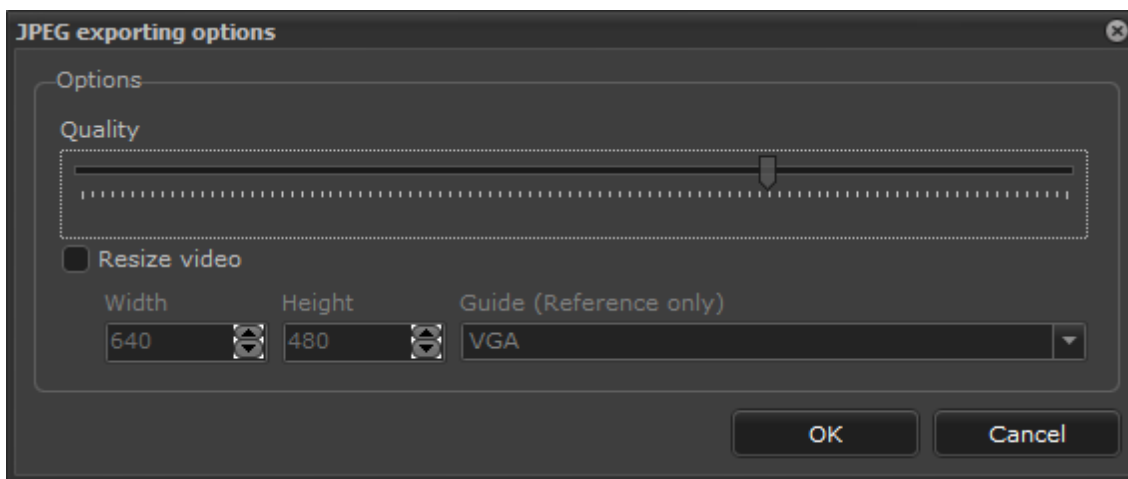

The media player now allows video export in JPEG images sequence.

In this export standard, all video frames are converted into individual JPEG images in the export folder, and can be used for example to create fast video time-lapse with any video editor since all video frames are available in separate files.

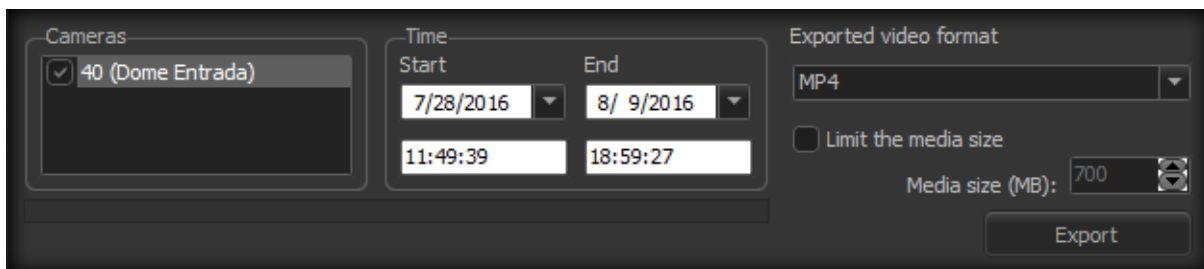

Each JPEG file will contain the original date and time of the recorded frame.

The system also allows the choice of JPEG compression quality and resize image during export

2.1.10 Exporting in MP4

The media player now allows native exporting to .mp4 format as a great alternative to .avi exporting

The .mp4 file format is extremely versatile and allows the encapsulation of multiple video and audio formats. The system can export video in .mp4 quickly without transcoding, packaging the original frames of video (audio will always be converted to AAC if it was recorded on another format) and providing an export without any modification of the original image data, but some formats may not be compatible with all video players (such as Windows Media Player which does not natively supports MJPEG and MPEG-4). In these cases the system allows the H.264 video transcoding (Along with AAC audio) to be compatible with most video players without the need to use special codecs, but the exporting is slower

since the video is recorded.

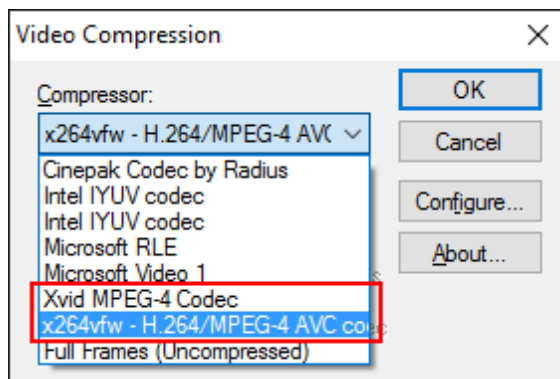

2.1.11 Codecs for AVI exporting

The system will now install by default 2 great codecs for using in video export:

- XviD MPEG-4
- x264

These codecs are widely used, compatible with almost all video players in the market and have excellent compression performance and quality.

The x264 codec will be selected by default when opening the export window in AVI

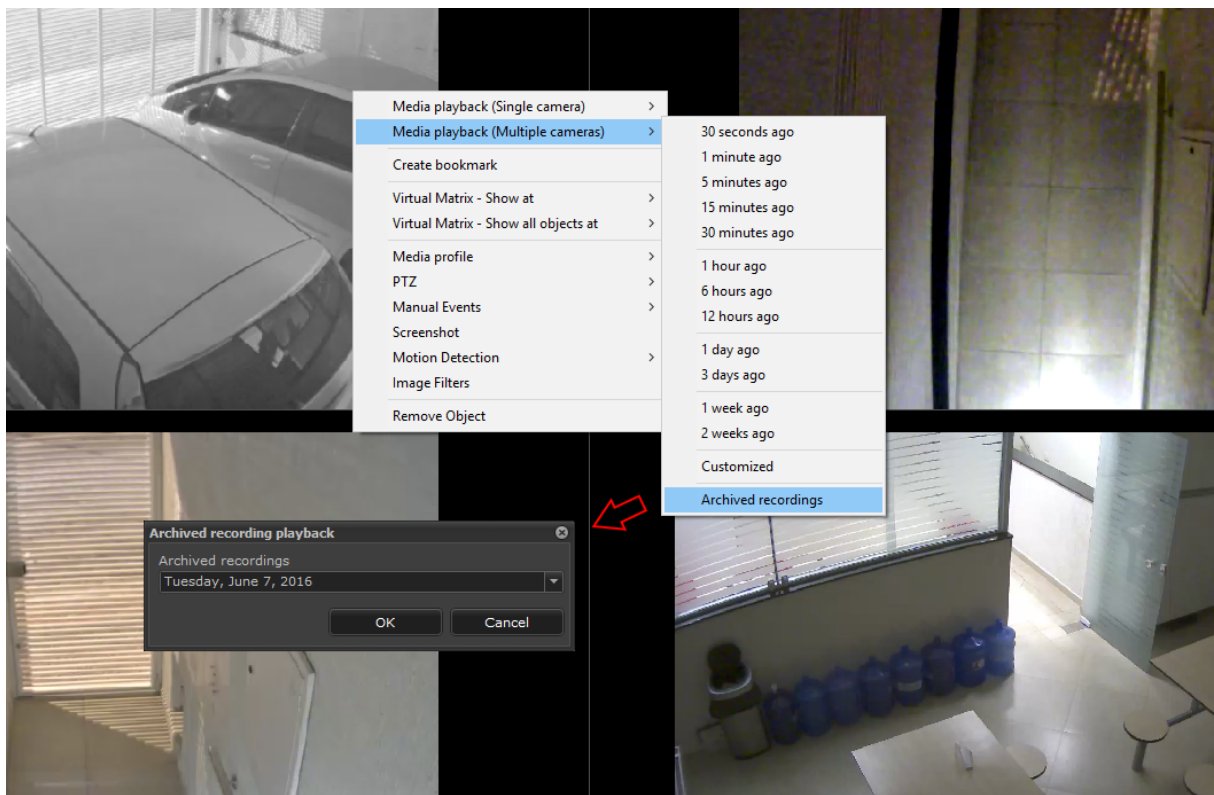

2.1.12 Playback of archived media

The system will now allow playback of archived footage through Surveillance Client.

Archived recordings are considered "Cold Storage" and are part of the archiving system, which can be configured to copy all recordings of previous day to another storage folder that can be located in a different storage device that usually has lower performance and lower cost.

Previously it was not possible to easily playback the archived recording, the user was required to manually select the archiving directory from Surveillance Client and the PC would have to have direct access to the archiving folder. With this new option, playback of archived media is now native to the Client.

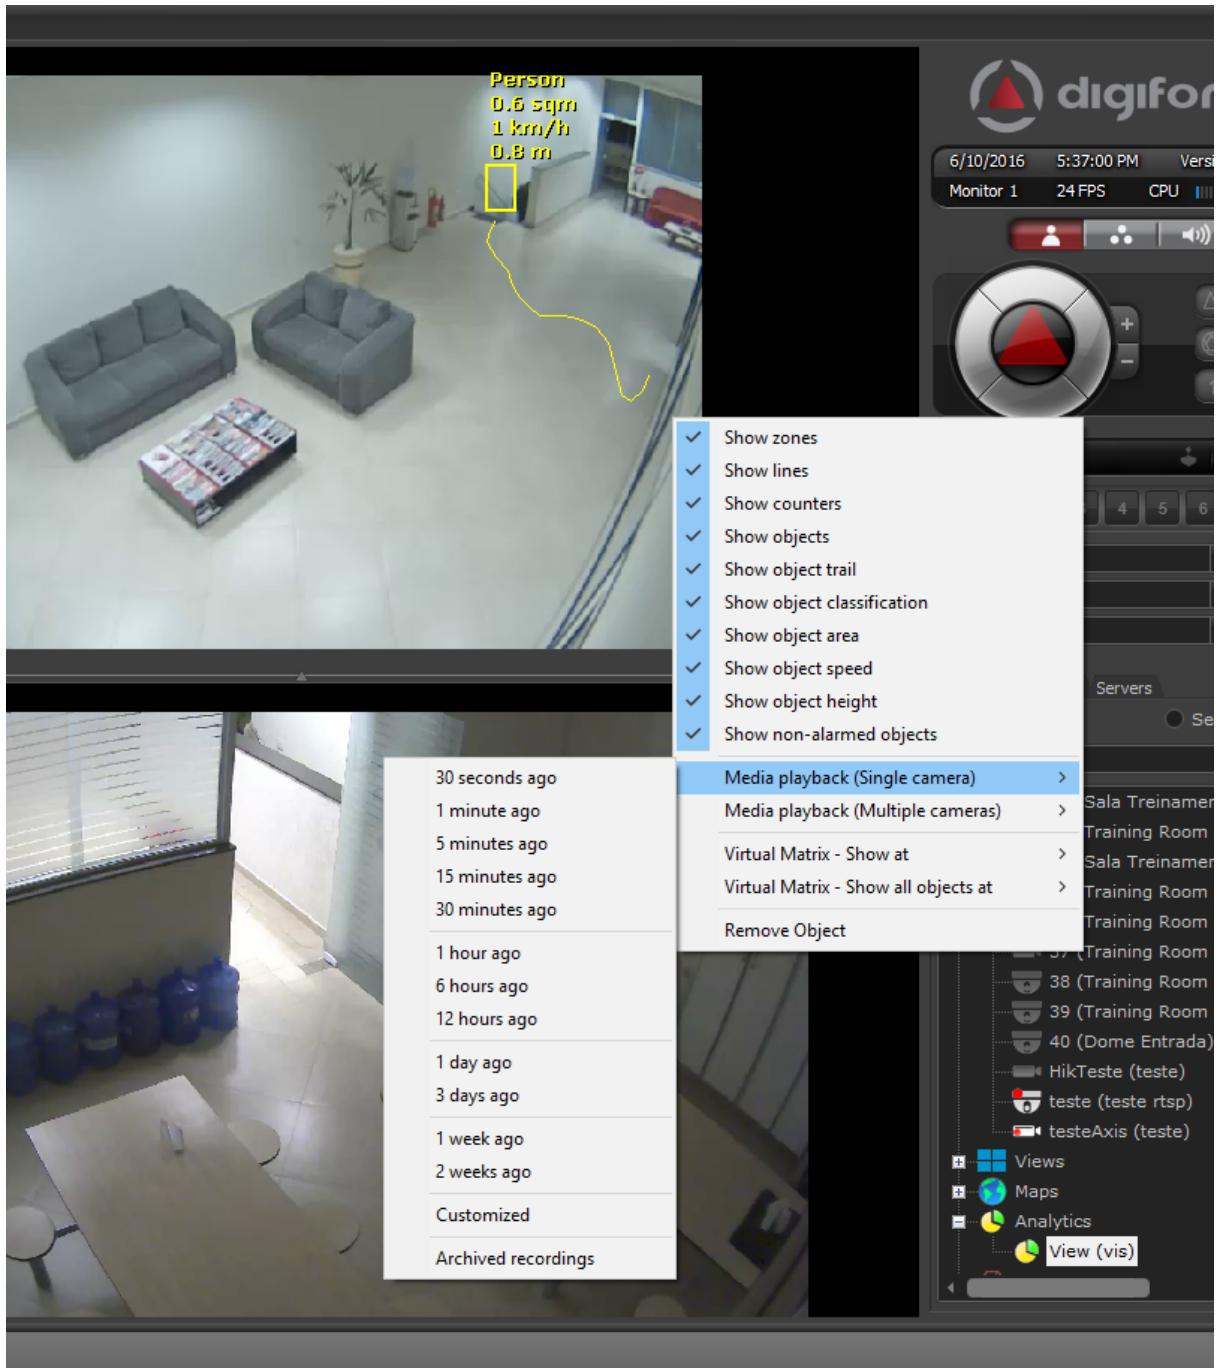

Due to the format of archived footage, it is only possible to playback 1 archived day per media session by selecting the available archived day through date picker screen:

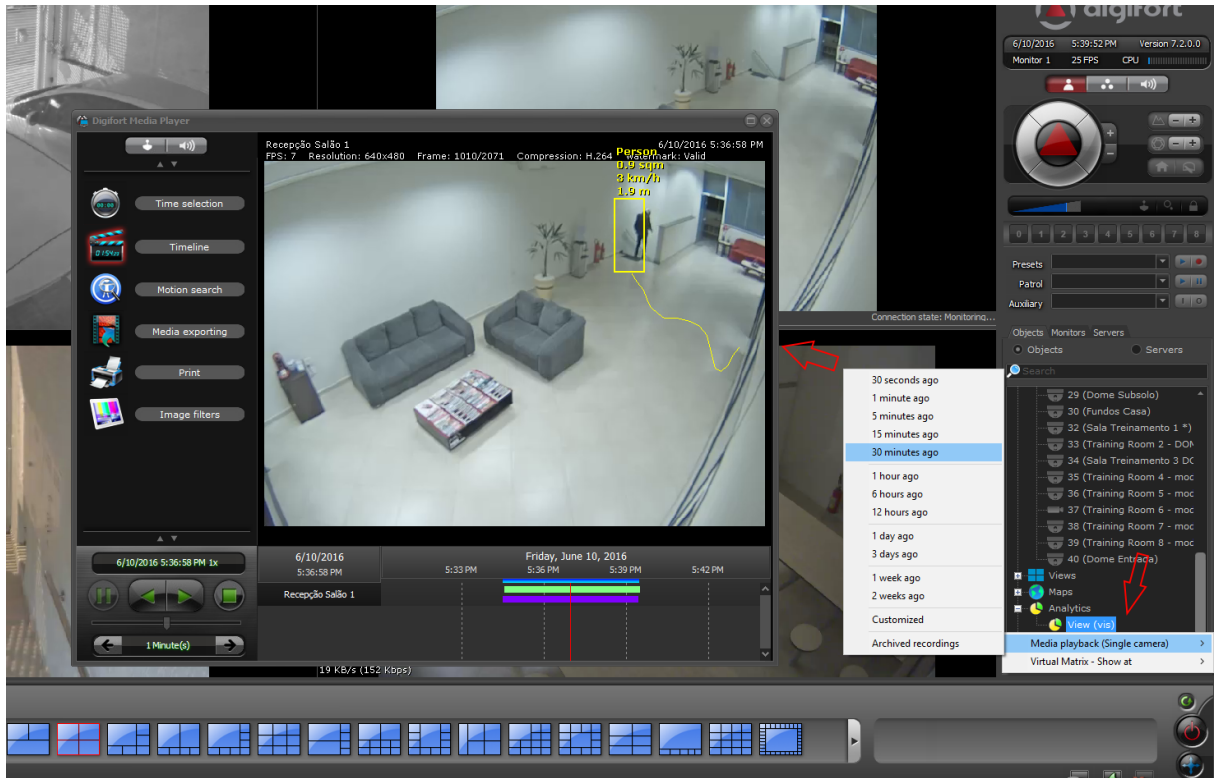

2.1.13 Playback of cameras from Analytics and LPR objects

In Surveillance Client it is now possible to playback video from cameras assigned to LPR or Analytics configurations by using the context menu with the right button of the mouse. In previous versions, only camera objects would offer the option for playback.

The camera assigned to the Analytics or LPR configuration will be played when selecting through these objects:

2.1.14 Alert e-mails with link to playback

The event action to send e-mails now allows attaching a script file that upon execution will open Surveillance Client and playback the video from cameras whose images were selected to be attached to the e-mail.

This feature will only work for the desktop version of Surveillance Client. In case the e-mail is open in a mobile device such as Apple or Android, the script file will not work.

Playback.dssf
542 bytes

Digifort - IP Surveillance System
GLOBAL EVENT - TESTE

You are receiving this e-mail as the server is configured to notify you whenever some global event is triggered.

Object data:
Name: TEste

Triggered by: admin
Station IP: 127.0.0.1

In case Surveillance Client is installed in this computer, please run the attached file to playback the video from the event

Attached pictures:

Image from camera 07 (Recepção Salão 1) from time 6/10/2016 5:51:32 PM

2.1.15 Alert e-mails with embedded analytics metadata

The system now allows the user to select an Analytics Configuration to send camera images in the event action to send e-mails. When an Analytics Configuration is selected, the system will send the e-mail with the camera image embedded with analytics objects metadata. Check below an example of a real e-mail that was sent:

Digifort - IP Surveillance System

GLOBAL EVENT - TESTE

You are receiving this e-mail as the server is configured to notify you whenever some global event is triggered.

Object data:
Name: TEste

Triggered by: admin
Station IP: 127.0.0.1

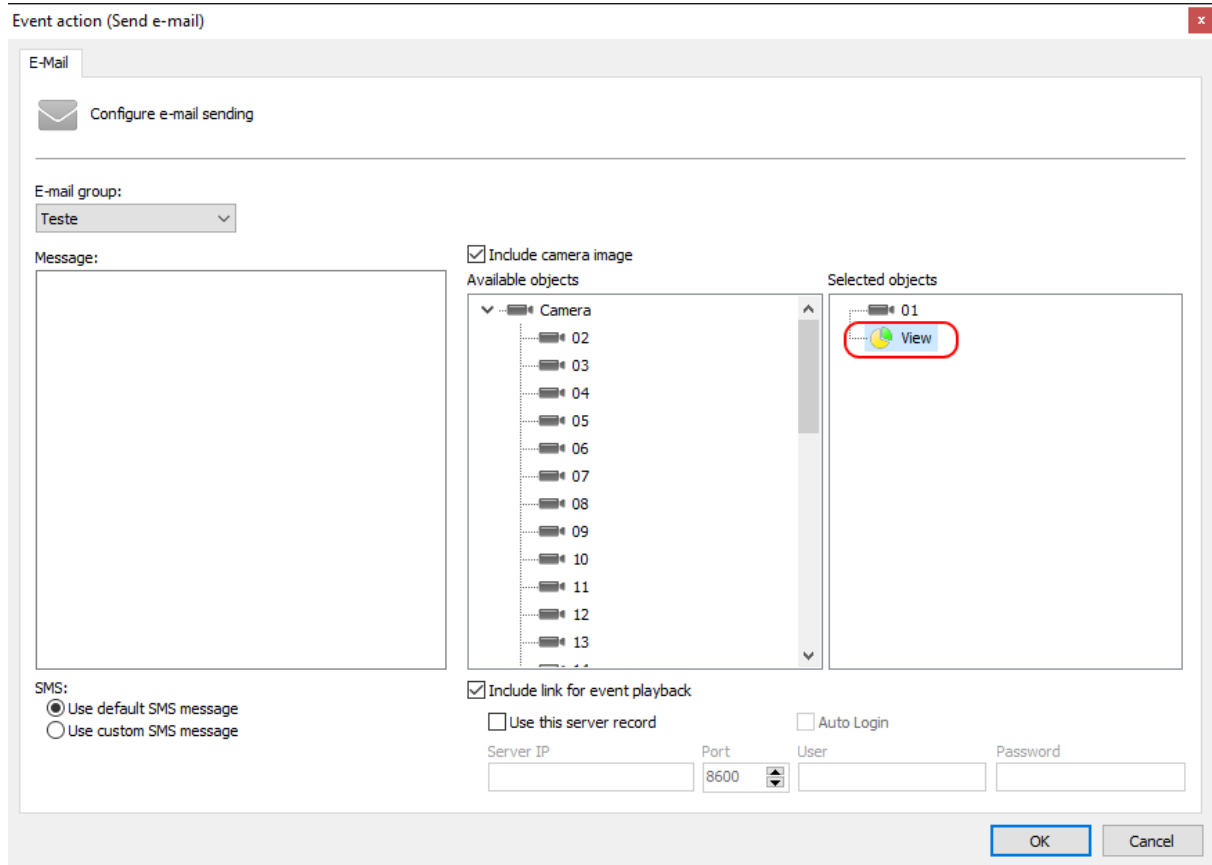

In case Surveillance Client is installed in this computer, please run the attached file to playback the video from the event

Attached pictures:

Image from camera 07 (Recepção Salão 1) from time 6/10/2016 6:02:11 PM

The settings of sending alert e-mails now allows the selection of both cameras and analytics objects:

2.1.16 Turbo exporting

The export mode option "turbo" was removed and now will always be used by default, i.e., exporting will always be at the highest possible speed

2.1.17 Instant update on timeline move

By moving the timeline in media player, by default the image update will only occur 500ms after the user stops moving it. A new option for instant update was added, with this option the image will be updated instantly by moving the timeline, which allows a quick view of events that occurred at different times by just quickly dragging the timeline (For this feature to work properly the client must be on a high performance local network).

This option will also change the behavior of the timeline by adding a drag-and-drop effect where the timeline will continue to move according to the force of movement.

2.1.18 Integration with Video Synopsis module

Video Synopsis module will now run inside Surveillance Client, facilitating its operation.

2.1.19 Printing playback images

The playback image print report will now always resize the images, maintaining the original scale, to fill the report space.

Page 1 / 1

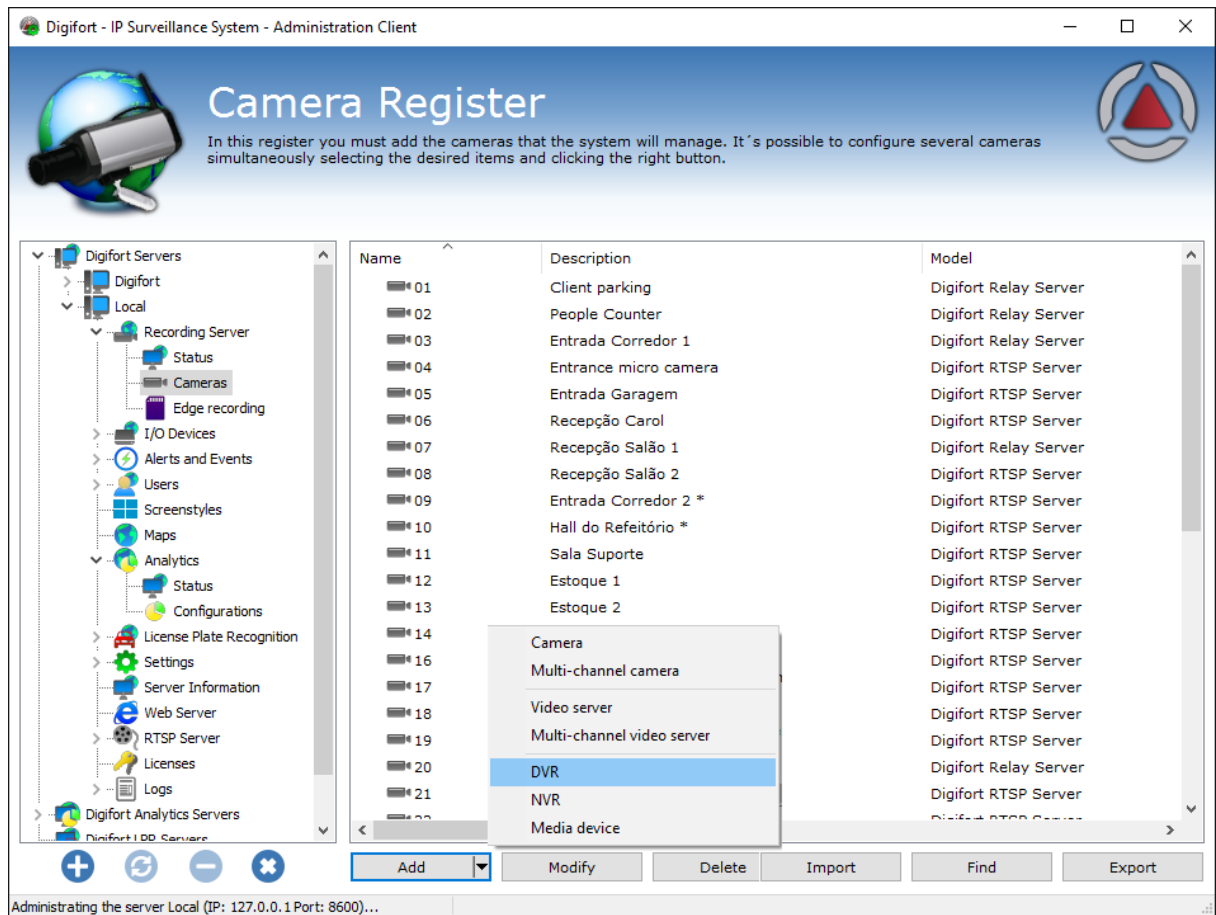

2.1.20 Privacy Mask with blur

The Privacy Mask feature now allows blurring areas of image option instead of a black rectangle covering the area.

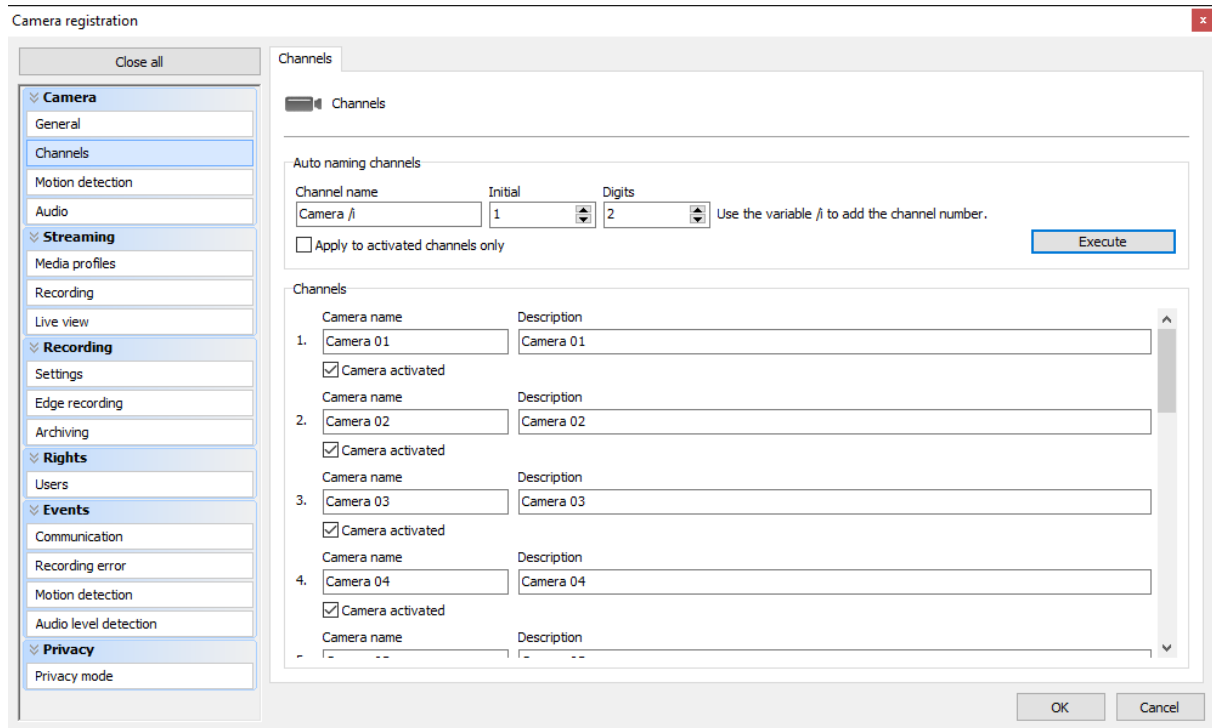

2.1.21 Easy registration of multi-channel devices

A new option to automatically register multiple channels of a multi-channel device such as DVR, NVR of multi-lenses camera was created.

A new option in the button to add new devices now allow the selection of multiple types of devices such as DVR, NVR and multi-channel cameras. When one of these options is selected, the system will filter the device database and will only display the devices matching the desired type in the screen to register the device as a way to ease the selection of device model.

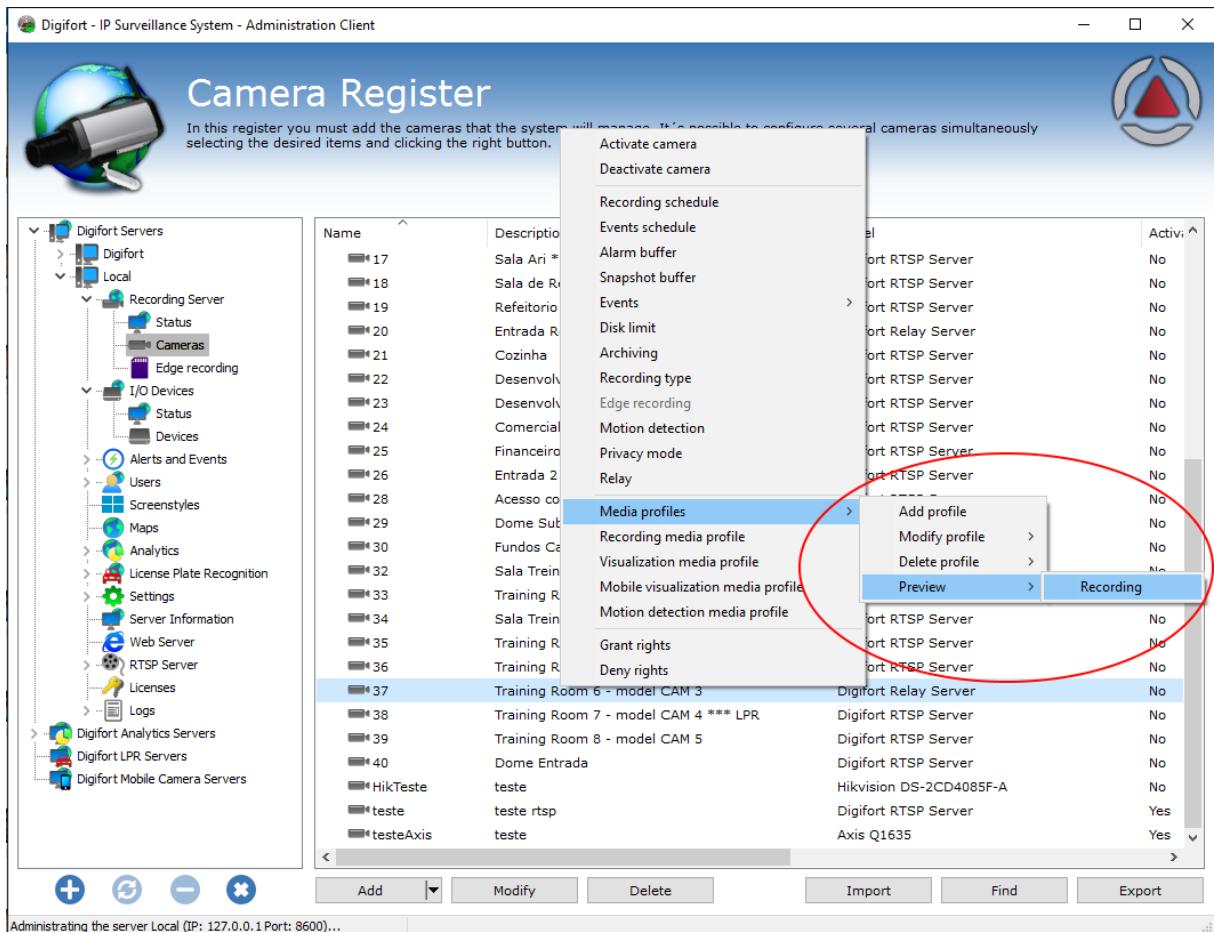

During the registering of a multi-channel device, some tabs will not be available (Tabs that are strict specific to each channel), e a new tab named "Channels" will be displayed to allow the individual naming of each device channel. An auto-naming tool is also provided in this screen, to help naming multiple channels.

All settings configured during the registration of multiple channels will be applied to all registered channels. Specific settings such as PTZ or I/O will have to be later adjusted to each registered channel.

2.1.22 Image preview on camera registration

In the camera registration screen it is now possible to preview the image of a media profile without opening camera registration, by using its context menu:

2.1.23 Customized positioning of alarm screens

It is now possible to customize how the alarm windows are organized on a monitor in the Surveillance Client, previously the windows were automatically positioned.

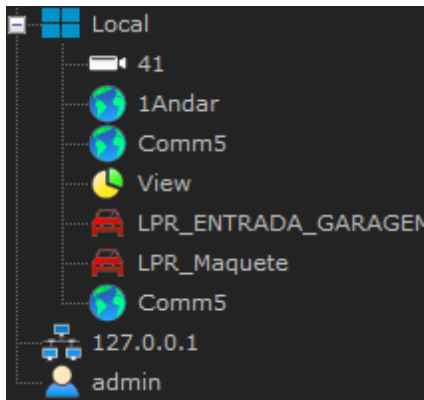

2.1.24 Displaying the name of objects on virtual monitor

When sending an object to the Virtual Matrix the system will now display the name of the objects currently being displayed on the selected monitor of the matrix

2.1.25 Status of objects in the list of virtual matrix monitors

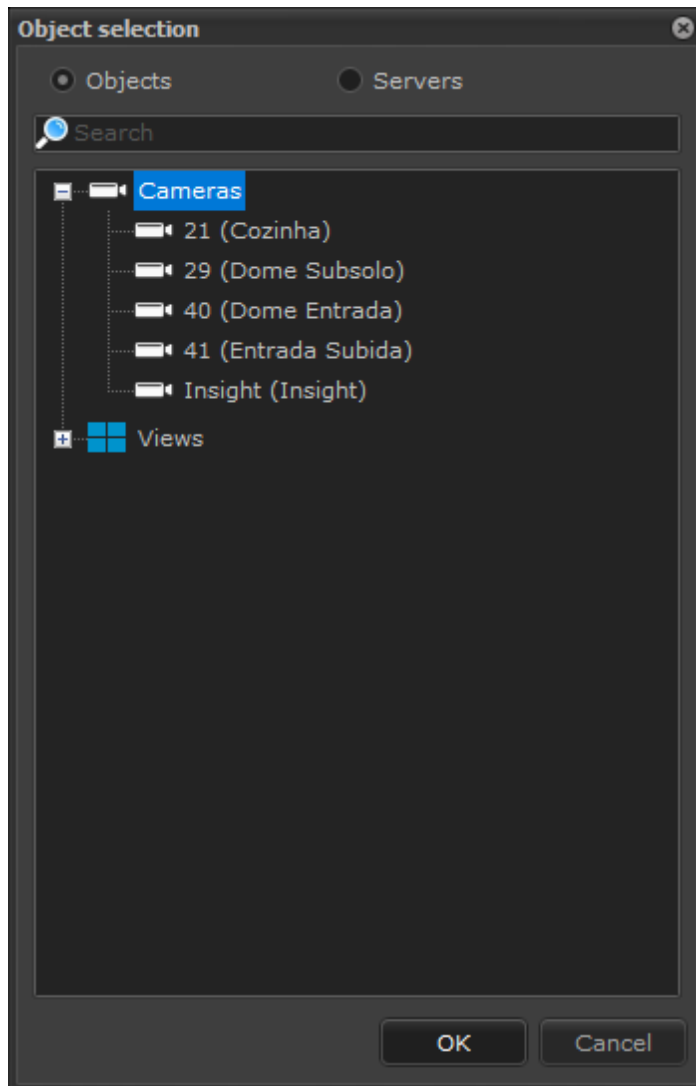

The Virtual Matrix monitor list in the Surveillance Client will now display the list of objects being displayed on the monitor

2.1.26 Object selection on media player

Media Player now allows searching by name of objects for playback.

The selection of views will now also follow the configuration of the Surveillance Client to display the views only from the selected layout or all views.

2.1.27 Disable the use of keyboard controller for playback

The Surveillance Client now allows you to disable the use of the Digifort keyboard controller for media playback. When the media player is opened the keyboard controller will continue to work for the selected live camera, sending PTZ controls to this camera instead of controlling the media player.

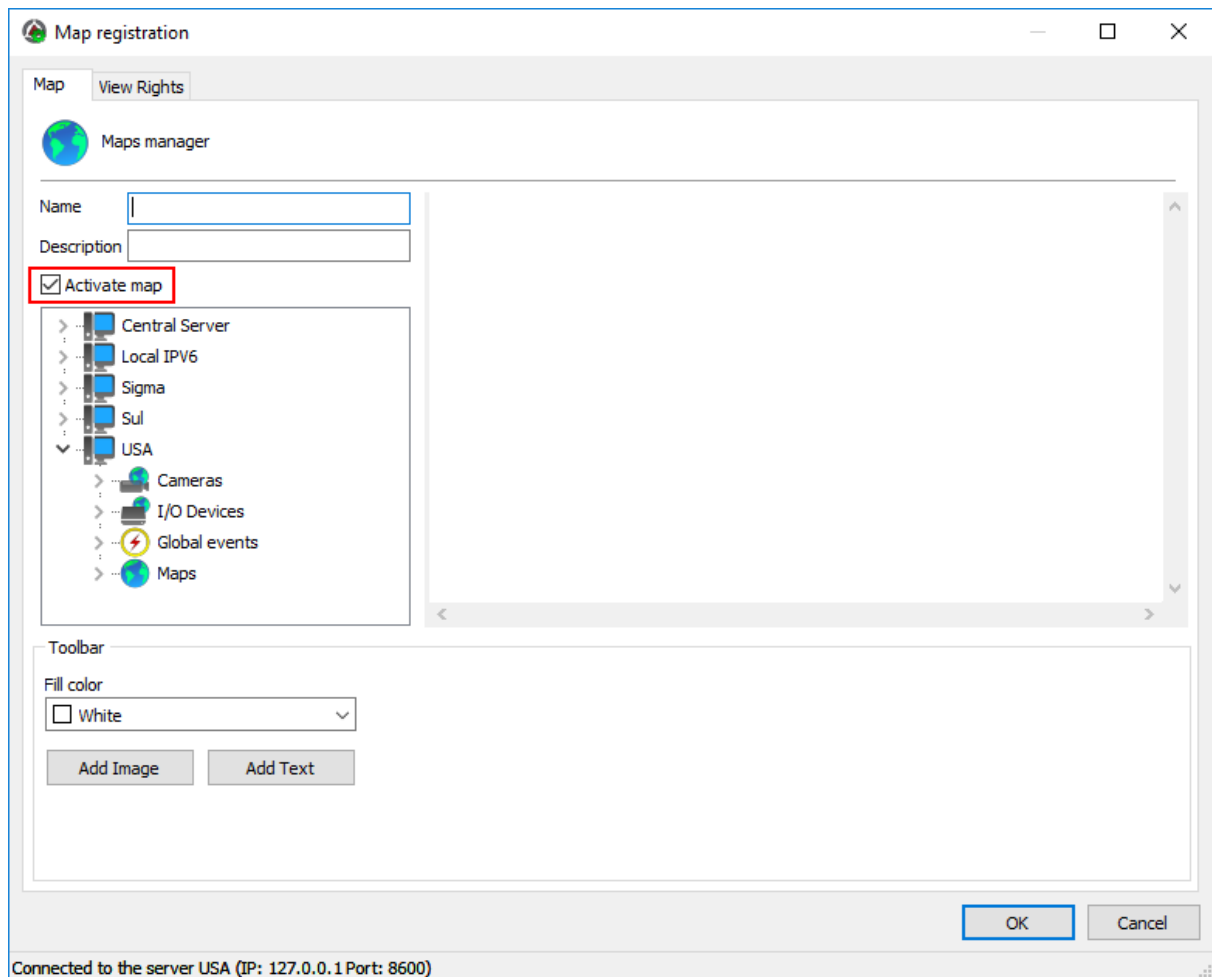

2.1.28 Close minimized Surveillance Client

Added option to close Surveillance Client when it is minimized in System Tray

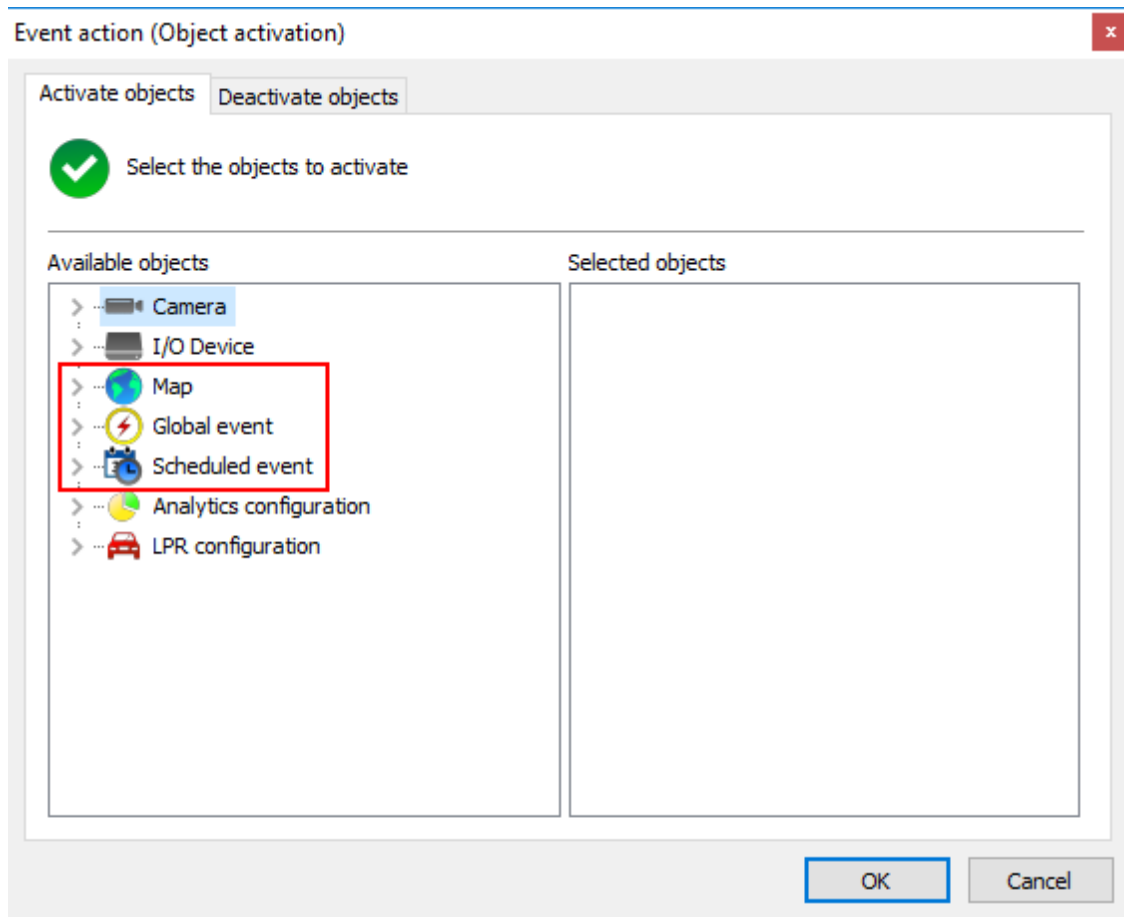

2.1.29 Activation or Deactivation of maps

The system now allows deactivating (or activating) maps.

2.1.30 Event action to activate objects

The event action to enable / disable objects now allows you to control maps, global events, and scheduled events.

2.1.31 Changing connection data for multiple cameras

The Administration Client now allows you to change the connection data (Address, Authentication and Timeout) of multiple cameras simultaneously.

21	Cozinha	Digifort Relay Server	-
29	Activate camera	P5522	5.15
40	Deactivate camera	fort RTSP Server	6.7.0
41	Recording schedule	fort Relay Server	-
ins	I/O Scheduling	fort InSight	1.0.0
/iv	Alarm buffer	tek SD9161-H	0100
	Snapshot buffer		
	Connection >	Address	
	Events >	Authentication	
	Disk limit	Timeout	
	Archiving		
	Recording time		

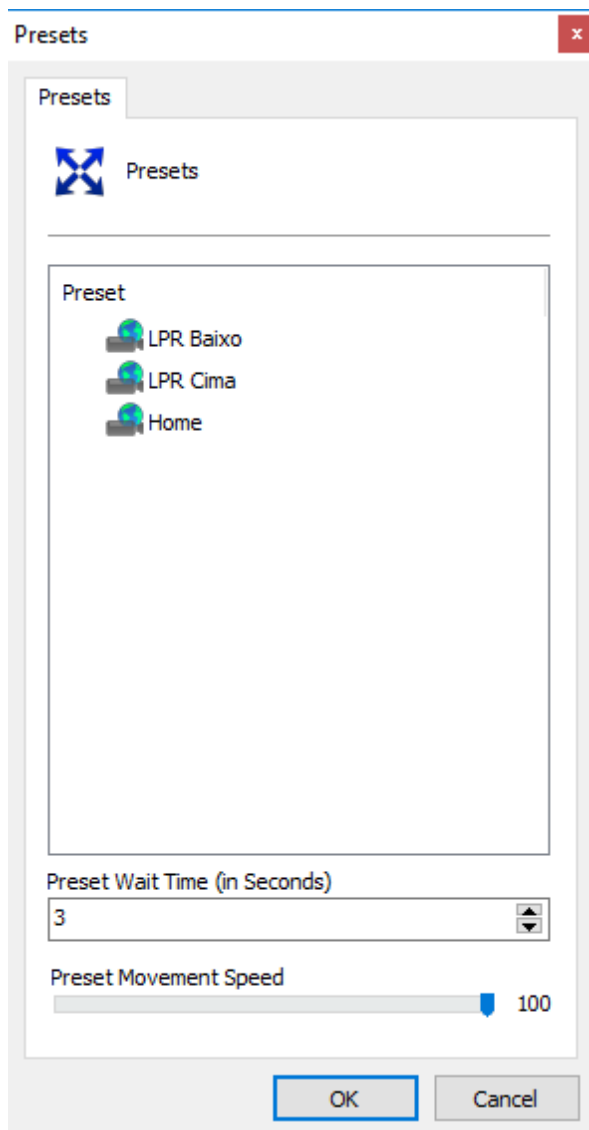

2.1.32 Automatic recording of metadata for analytics

The system now allows the recording of automatic analytics metadata, where the system will record the first analytics configuration that is in operation associated with the camera. This enables the recording of analytics metadata for PTZ cameras with different analytics settings in different presets.

2.1.33 Add multiple presets to patrol

It is now possible to add multiple presets simultaneously to a PTZ Patrol profile through the Administration Client. Previously the presets should be added individually.

2.1.34 Recorded days in system report

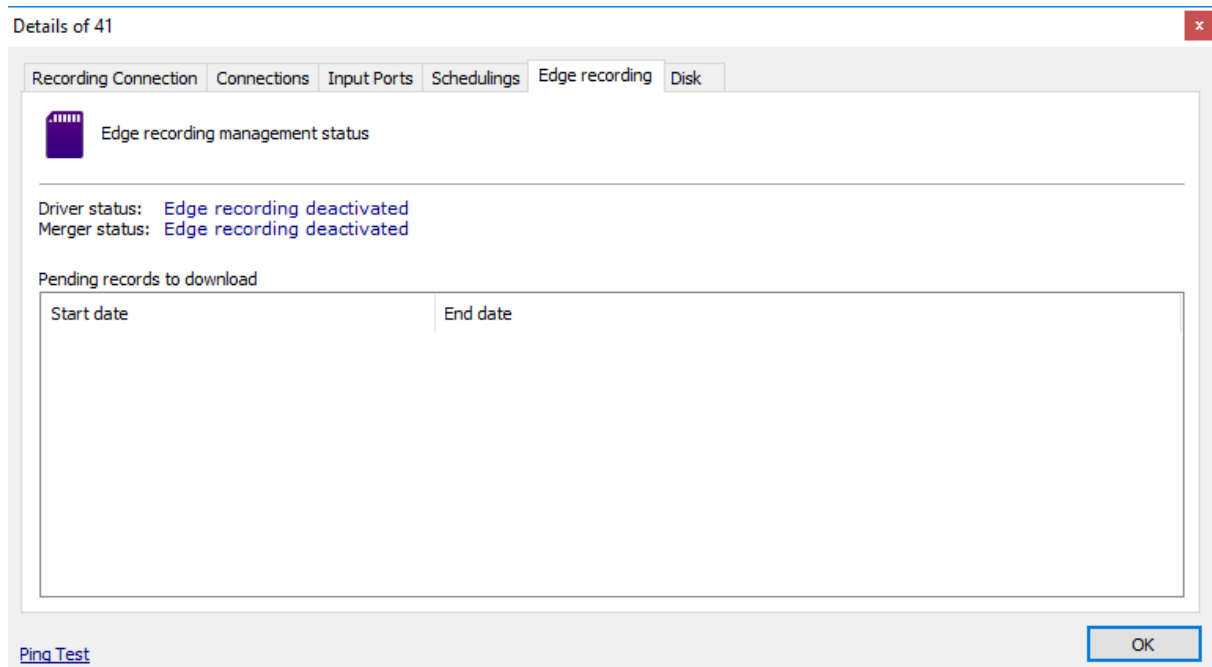

The periodic server report will now include the amount of days recorded and estimated recording of each camera system.

Camera: 40
Description: Dome Entrada
Active Time: 0 Hour(s), 2 Minute(s) and 34 Second(s)
Recorded video frames: 4356
Recorded audio frames: 0
Limit: 132,874 MB
Recorded days: 10 Day(s) and 21.1 Hour(s)
Recording estimative: 359 Day(s) and 22.8 Hour(s)
Bytes written: 1,862,729 Bytes - 1 MB
Used disk space: 4,211,228,635 Bytes - 4,016 MB

Camera: 41
Description: Entrada Subida
Active Time: 0 Hour(s), 2 Minute(s) and 34 Second(s)
Recorded video frames: 1073
Recorded audio frames: 0
Limit: 49,247 MB
Recorded days: 10 Day(s) and 21.1 Hour(s)
Recording estimative: 360 Day(s) and 1.4 Hour(s)
Bytes written: 1,810,648 Bytes - 1 MB
Used disk space: 1,560,851,905 Bytes - 1,488 MB

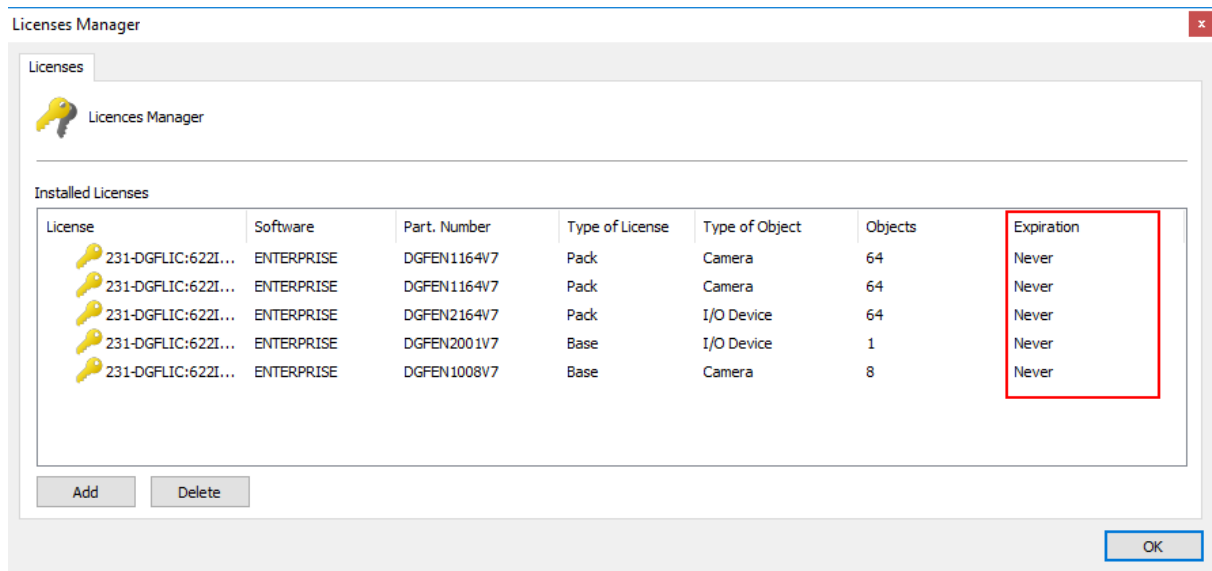

2.1.35 Remove multiple edge recording jobs from a camera

It is now possible to remove multiple edge recording jobs simultaneously through the Administration Client.

2.1.36 License expiration field

Added a field for viewing the license expiration in the license manager of the administration client.

2.1.37 New LPR engine

A new LPR engine (Neural Labs) was added to the system. This is an alternative to the Carmen engine and has excellent performance and quality recognition.

2.1.38 New Surveillance Client restrictions

Added two (2) new restrictions for Surveillance Client usage per user or group of users:

Hide system operating controls: This option will cause the Surveillance Client to operate in "full screen" mode, ie the camera view matrix will be expanded and the user will not have access to any operation control, getting restricted to the camera preview screen.

Disable context menus: This option will disable the use of menus accessible via the right mouse button, further blocking the operator access to the system.

Together, these two options can be used to completely block the operator access to any operation except viewing live cameras.

2.1.39 Event to cancel a timer

The timer event is now more flexible and can be canceled by another event before its trigger occurs, allowing such operations as "door open too long" to trigger an alarm if a door has been left open

Timer Event

Timer event settings

Event Name

Event Description

This event occurs after: (Seconds)

5

Configure the actions to be executed in case of the event:

Configure Actions

Cancel timer on event

Event to cancel timer

OK Cancel

2.1.40 Surveillance Client operation buffer

Some operations on the Surveillance Client will generate a temporary buffer on the computer to speed up its performance.

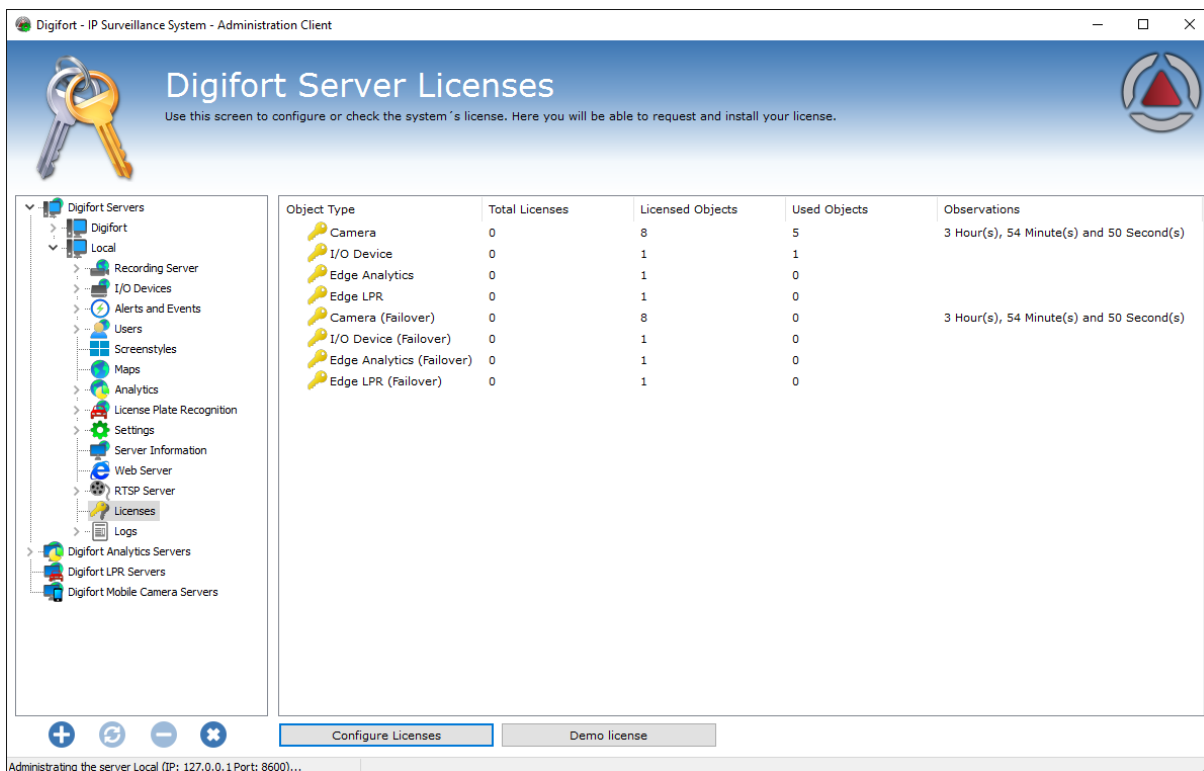

Video playback for example will temporarily write to disk all the images received for quick access if the operator wishes to re-watch portions already downloaded, with this the client will not need to download the image again, saving server and network resources. After playback is complete, these temporary files will be deleted.

Downloaded maps are saved so it will not be downloaded again in the future, saving time and bandwidth during the connection process with the server.

This feature was already available in the system in previous versions, but the buffer was written in the installation folder of Surveillance Client that by default is the Program Files and the system can not write to a subfolder unless running in Administrator Mode, rendering the feature useless. To improve this behavior the buffer will now be recorded to a temporary subfolder %TEMP%\Digifort allowing proper use by the system and improving its performance.

2.1.41 New licenses summary screen

A new licenses summary screen was developed to improve the visualization of available and used licenses per object type:

2.1.42 Verification of offline devices

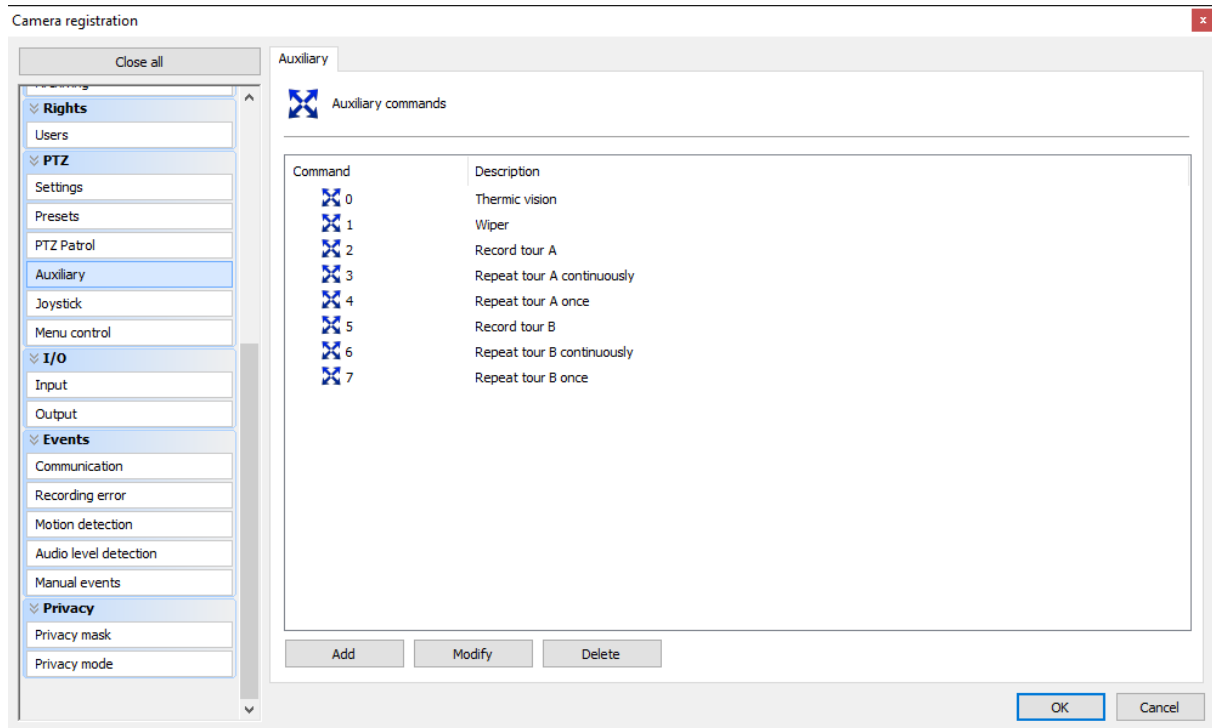

For cameras configured to not record or record upon events, the system was not able to check if it was working or not due to the fact that no connection was established to the device. A new verification routine was added for this specific scenario. In this new method, the system will check if the camera is working in an interval of 1 to 3 minutes, if the camera does not reply to the request, the system will consider that it is not working.

2.1.43 Audio recording on motion detection

The behavior of audio recording when camera is configured to record by motion detection was changed. Previously the system would record the audio track continuously, regardless of motion being detected or not, now the system will record audio only when motion is detected, keeping both audio and video tracks synchronized.

2.1.44 Pre-registered PTZ auxiliary

Some PTZ cameras provides auxiliary commands to access some specific functions. For this cameras the system will now provide a pre-registered list of auxiliary commands that are natively supported by the driver.

2.1.45 Improvements to RTSP Server

- A new internal media buffer was implemented in the RTSP Server to improve the transmission of media in connections slower than the original camera bitrate
- Transmission of MJPEG over RTSP now uses less server memory

2.1.46 Improvements to recording and timeline reading

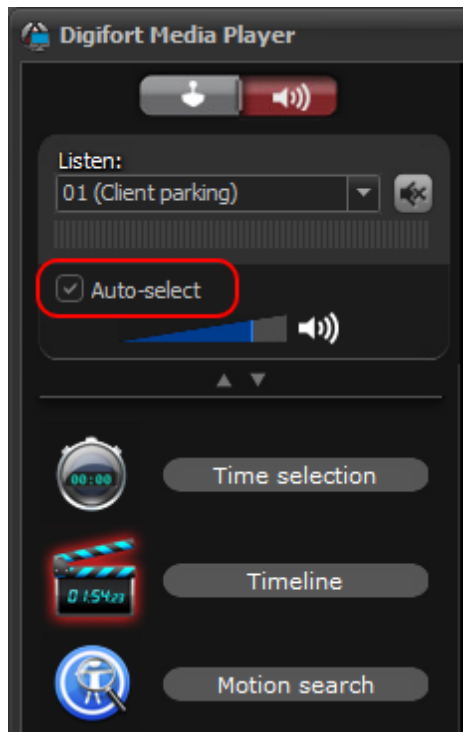

The reading of media recordings and timeline during a media playback was extremely optimized. A new data caching system was implemented which prevents multiple accesses to the disk, drastically increasing the recording reading performance, timeline loading time and significantly decreasing the workload of the storage HDs during the process of media playback.

During the tests of the new implementation, in a media playback of 16 cameras recording at 30 FPS with audio, the system would require about 2400 I/Os per second for data reading, now this value was reduced to 32 I/Os at each 20 to 30 seconds depending on the size of recorded data.

The playback process will no longer affect the performance of recordings (When using low-performance storage).

2.1.47 Better audio control in playback

As the control for live audio, now the audio control of media player also provides the option for "Auto-select"

2.1.48 Playback time in audit records

The record for media playback in system audit will now inform the initial and final date/time of the media session. With this information it is now possible to identify exactly the period of time of which an operator visualized the recordings.

Close

2.1.49 Better management of server connections in Surveillance Client

The management of Digifort server connections in Surveillance client was improved.

Previously, when a connection to the server was lost, the objects from this server was removed from Surveillance Client and a screen refresh was performance, causing a "flicker" to the user. This effect could be more evident in installations where the Surveillance Client would have to connect to multiple remote servers with bad internet connection.

Now, in case of communication failure, the system by default will no longer remove the objects of this server from the screen and will no longer refresh. When the connection is re-established, the objects on screen will be updated (only the objects of the affected server) and this will provide a much better experience to the operator.

2.1.50 Failover operation option

A new option to activate the operation with Failover servers was added to Surveillance Client. Activate this option in case Surveillance Client has to connect to a Failover server. This option will reactivate the old system behavior in case of communication failure to the server (usually due to server failure), the system will remove the objects of this server from the client so it can load the correlated objects from

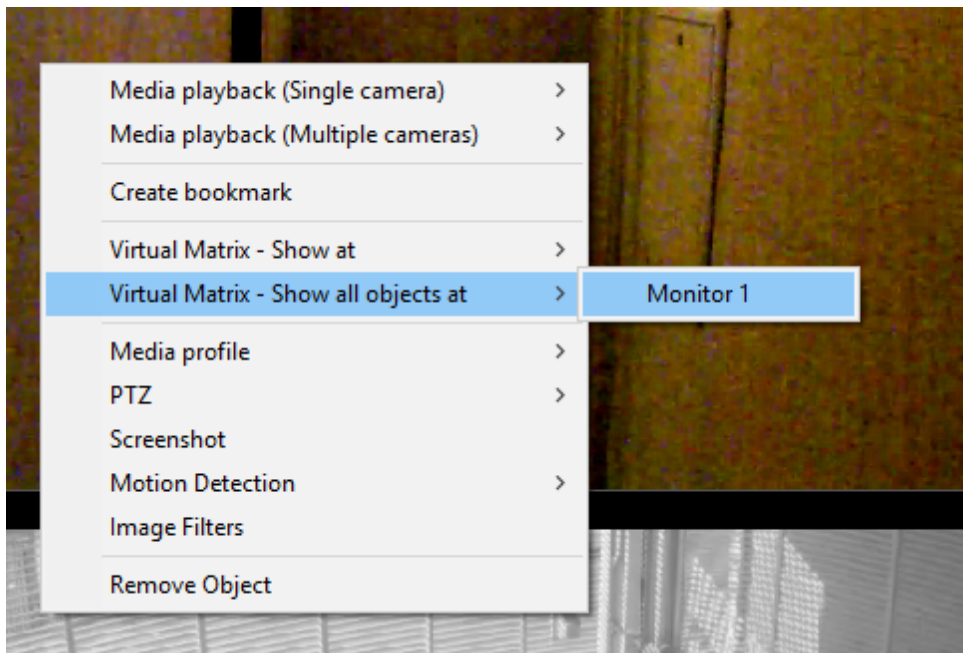

Failover server, assuring a smooth transition to the new server in case of system failure.

2.1.51 Send multiple objects to Virtual Matrix

This new option of Virtual Matrix allows sending all objects on the screen along with its configurations (Current media profile, zoom position, 360 lens position, image filter and motion detection).

This option is available only for current objects on screen. Upon clicking with the right button of the mouse on any object (or on an empty screen) the option to "Show all objects at" will be provided. The view should **not** be saved for this option to be used.

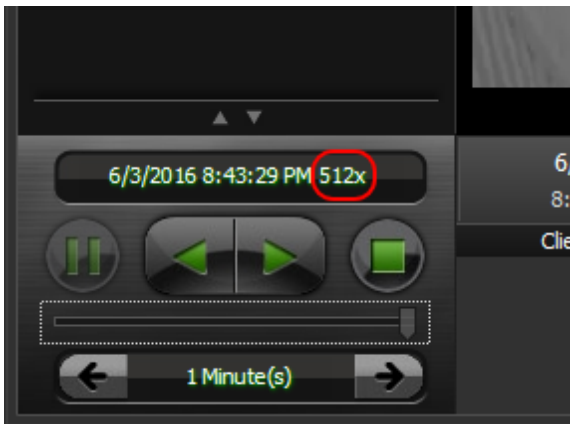

2.1.52 Media exporting with camera description

Upon exporting videos in native format, now the camera description will also be included (not only its name).

2.1.53 Improved accelerated playback

The accelerated media playback was greatly improved to allow a higher refresh rate of images. Previously the system would only show 2 frames per second in an accelerated playback. The playback experience should be much better for the user now.

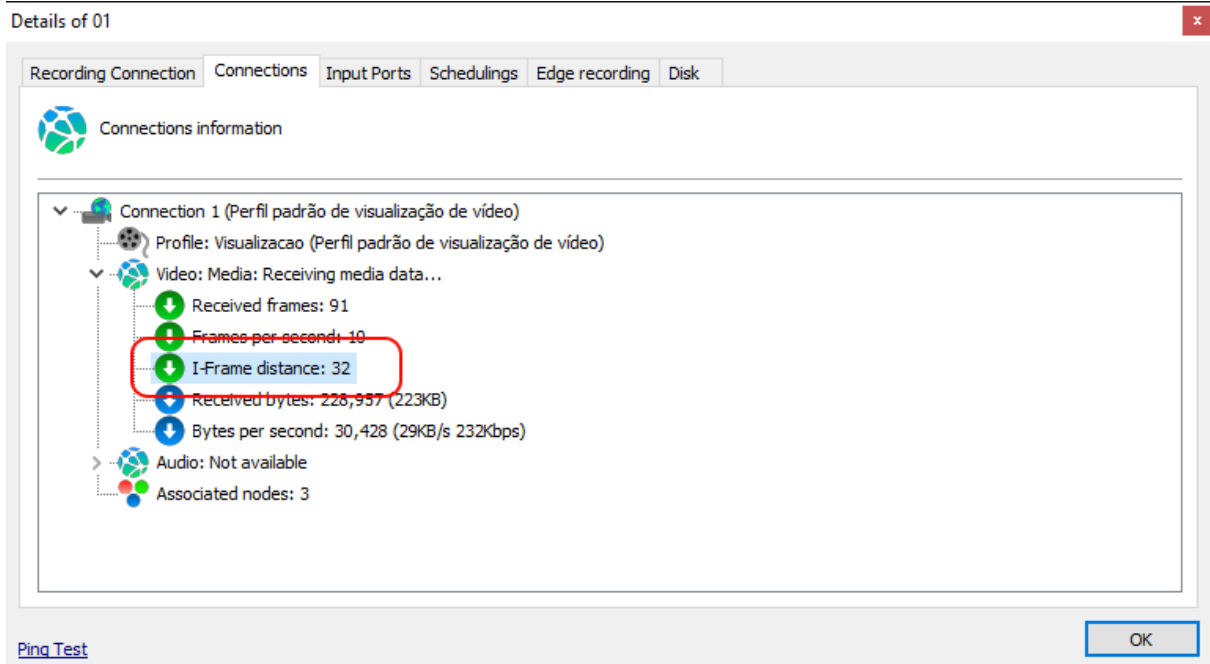

2.1.54 Recording error rearm time

To prevent the system to trigger multiple recording error events (In case of recording errors), the system was configured to trigger only 1 alert event per hour in case the error persists.

2.1.55 I-Frame distance information

The system will now inform the distance of I-Frames in H.264 and MPEG-4 videos. This information is extremely relevant because it directly affects the behavior of the cameras, as for example the delay time for an image to start displaying in the Surveillance Client.

This information will be available in Administration Client, under stream status:

It will also be available in Surveillance Client, on all camera images:

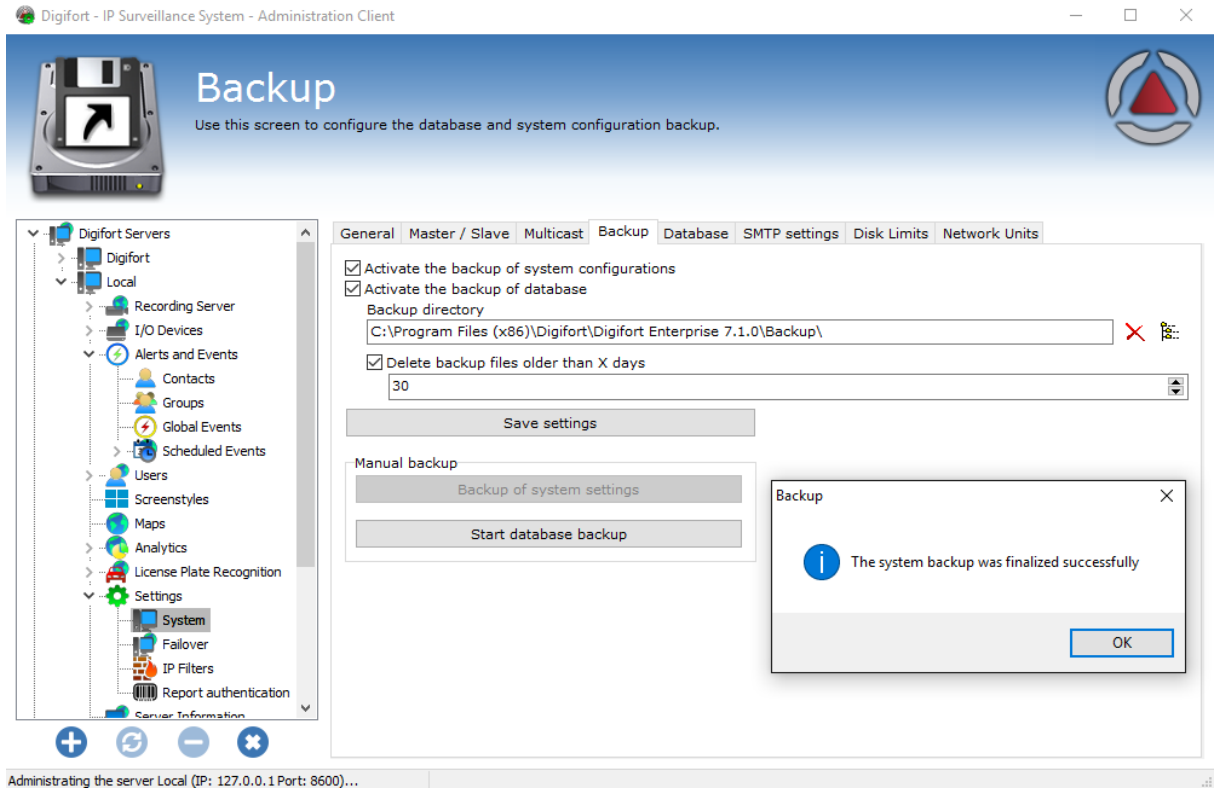

2.1.56 Master / Slave Admin password

In the Master / Slave architecture, the password of admin user must be configured in all slave servers so they can properly connect to master server. Now upon modification of admin password in master server, it will be automatically changed in the settings of all slave servers, so no communication error will happen.

2.1.57 Backup finished message

The system will now show a message when the backup of system settings is finalized. Previously a message was displayed at the beginning of the process.

2.1.58 Organized disk charts

The disk usage charges are now sorted alphabetically.

2.1.59 Better management of media profiles

The Administration Client now allows for a better management to add, modify or delete media profiles from multiple selected cameras simultaneously.

Previously it was only possible to modify or delete media profiles that were common to all selected cameras. Example: Camera 01 had profiles "Recording" and "Visualization" and Camera 02 has profiles "Recording" and "Internet", in this case, only the media profile "Recording" could be changed simultaneously for both cameras.

With the new improvements, any profile can be changes, new profiles can be added, and any profile can be deleted.

When a new profile is added, if it already exist in any selected camera, a warning message will be displayed and old profiles will be replaced by the new one.

When a profile is modified or deleted, only cameras containing those profiles will be modified, the rest of the selected cameras will remain unchanged.

2.1.60 Possibility to delete multiple objects

The Administration Client now allows deleting multiple selected objects simultaneously from any list of objects in the system such as cameras, users, I/O devices, maps and others.

2.1.61 New snapshot formats

The Surveillance Client now supports additional formats to save snapshots: JPEG, PNG, Bitmap, WMF e GIF.

2.1.62 Ping test for I/O devices

The Administration Client now allows the execution of a ping test with I/O devices from registration and status screen.

Active time: 0 Hour(s), 0 Minute(s) and 11 Second(s)
Inactive time: 0 Hour(s), 0 Minute(s) and 11 Second(s)
Status: Not working

Ping Test OK

2.1.63 Open field to type device model name

The Administration Client now provides an open field for "Manufacturer" and "Device model". This will ease the registration of new devices allowing the user to type only part of the model name which will

cause a look-up and system will auto-complete the field with the matching closest device name. Additionally the manufacturer name was removed as prefix from the "Model" field to allow the typing of model device.

Camera registration

Recording directory Connection timeout (ms) 30000

Activate camera

OK Cancel

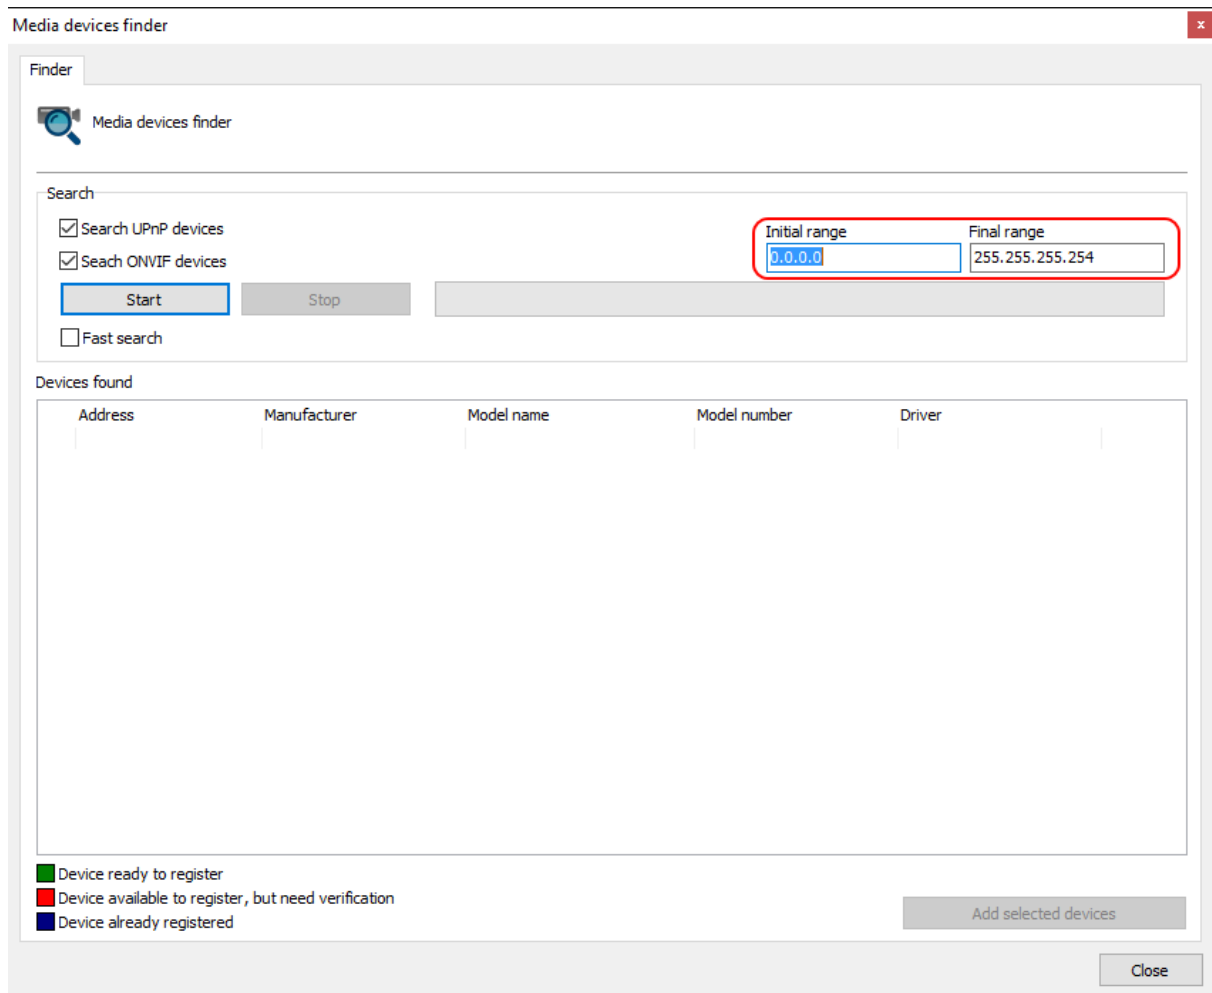

The screenshot shows the 'I/O Device' configuration window. The 'General' tab is selected. The 'Manufacturer' dropdown is set to 'Aviosys' and the 'Model' dropdown is set to 'IP Power 9211 Delux'. The 'Firmware' dropdown is set to '2.05'. The 'Inputs' field is set to '8' and the 'Outputs' field is set to '0'. The 'Port' field is set to '80'. The 'Activate device' checkbox is checked. The 'OK' button is highlighted with a blue border.

2.1.64 Edge recording download control

The system will now only start downloading edge recorded videos that are at least 10 minutes old. For example, if the server clock is 14:00 and a video from 13:30 to 14:00 should be downloaded from the camera, the system will only start its download at 14:10. This "delay" was introduced due to the fact that some cameras need extra time to "finalize" its current recordings.

2.1.65 Searching for devices with IP Range

The tool to search for network devices now allows the results to be filtered to a given range of IPs.

2.1.66 Better performance for objects list

The objects list in Surveillance Client was improved for better performance and behavior.

2.1.67 Configuration data in registry (64bit)

When the server is running in 64bit operating system, the system configuration data was stored inside a special compatibility key named Wow6432Node, now with the new 64bit version, the configuration data will be moved to the regular 64bit key in windows registry, both 32bits and 64bits version will access the same configuration data. This change also allows the system configuration backup to generate only 1 backup file, instead of generating a 32bit and 64bit versions of the backup as previously.

Warning: With this change, a system downgrade will not be possible because the settings will be moved to another registry key. Before updating to 7.2 backup your system settings using Administration Client, and in case a downgrade is required use the backup file to return the settings of the older version.

2.1.68 New audio codecs

The library for G.711 and G.726 was updated to provide better performance, compatibility and audio quality.

2.1.69 Improvements to database connection

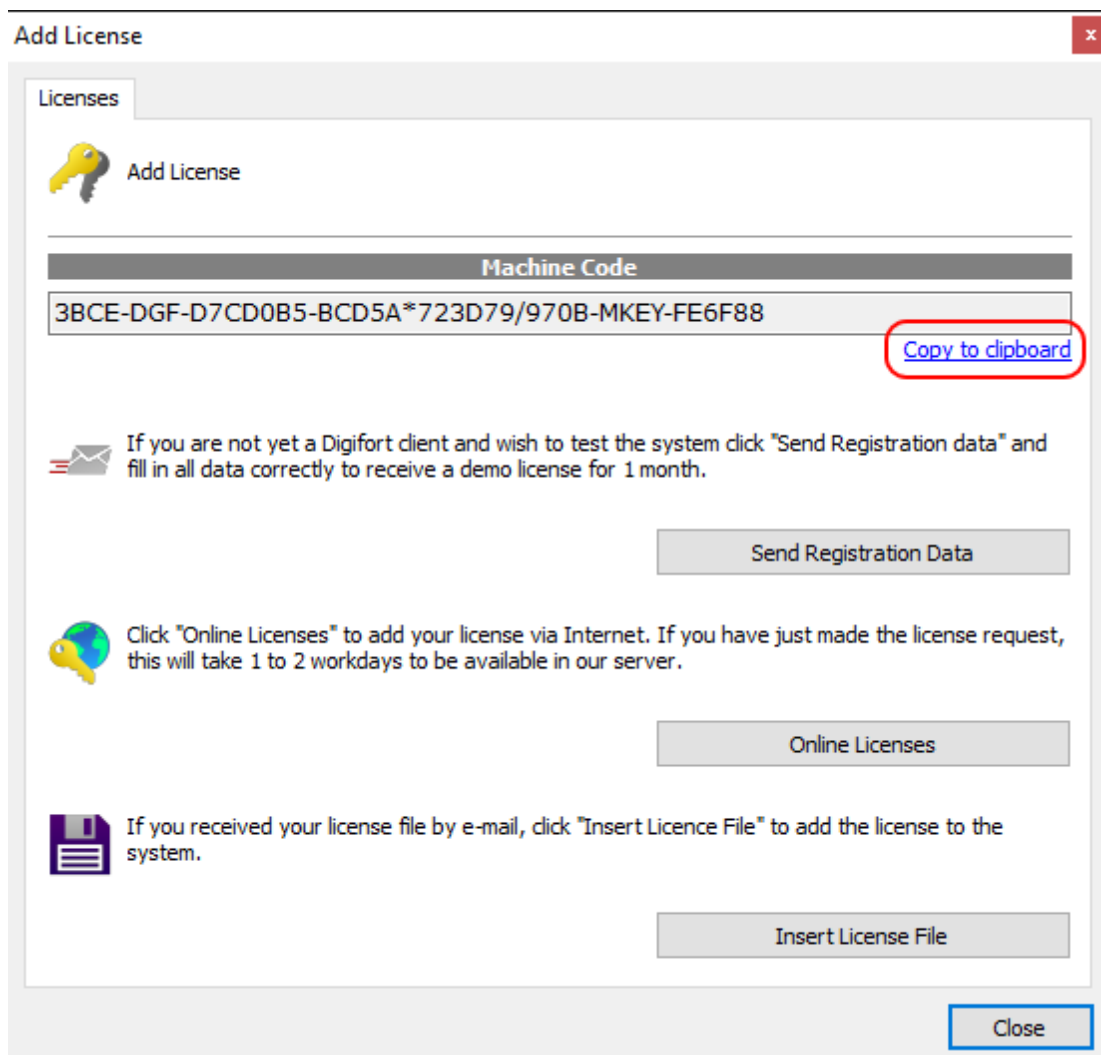

The connection with the system database was improved and should be more stable now. In case of any database communication error, the system will log an error and will send a message to Administration Client only. Surveillance Client will no longer receive any database error messages.

2.1.70 Playback with DGF-KB1000 keyboard improved

The playback controls with DGF-KB1000 were improved.

2.1.71 Copy machine code to the clipboard

A new option to copy the machine code to the clipboard was added to the licensing screen. Additionally the version and edition of the system is also copied.

2.1.72 Timeline zoom animation

The zoom operations on media player timeline will now display a transition animation to provide a more user-friendly interface.

2.1.73 Improvements to ONVIF driver

- Updated compatibility with protocol version 2.5
- Added support to continuous movement of PTZ cameras with implementation older than version 2.0
- Improved the stability and performance of the communication driver

2.1.74 Improvements to Axis PTZ driver

The PTZ driver of Axis video servers was improved to use a new method to transmit PTZ commands for analog cameras using plain TCP.

2.1.75 Digifort RTSP driver audio output

The communication driver "RTSP Digifort" that is used to create interconnection between Digifort servers now supports audio output.

2.1.76 Barco video wall integration improvements

Camera description will now be displayed as a decorator in Barco video wall and will also be displayed on side-bar.

Barco video wall integration now requires an integration license.

2.1.77 Quick Support

A new quick support tool was added to the release. This tool will allow the remote access from Digifort technicians to help customers with problems or optimizations in an easy, fast and secure way.

2.1.78 New features to Standard edition

The following pre-existent features in superior editions were added to Standard edition:

- Support to Edge Analytics (Executed in the camera)
- Support to Edge LPR (Executed in the camera)

2.2 New supported devices

CodBox 8822
Commbox MIO-402
CommVerge COMM4IO
Fiber SenSys FD-322
Fiber SenSys FD-508
Fiber SenSys FD-525R
Optex PIE-1
ST Electronics AgilFence

2.3 Fixes

- Fixed a small issue in the management of connections that could cause memory access violation for invalid commands that were sent to the server
- The icons of I/O events (Alarm input) placed on a map would not "trigger" in case of an alarm
- The archiving system was sending 2 e-mails upon finish of the process if audio was being recorded along with video
- During media playback of multiple simultaneous cameras, the timeline of some cameras might not

load

- Fixed a problem upon importing a list of license plates with empty lines or invalid characters like comma
- Fixed a problem in communication drivers of American Dynamics devices that could cause a failure in communication at each 1 hour and 10 minutes
- Fixed a problem in PTZ drivers of analog cameras that could cause the system to send repeated PTZ commands
- Fixed a profile in RTSP server that could cause decoding error for MJPEG video
- When minimizing a monitor of Surveillance Client it could not appear in System Tray in case multiple instances were open simultaneously in the same monitor when using manual mode
- Fixed an issue with memory management when closing Surveillance Client when a camera was still selected
- Fixed a thread leaking problem on media playback. This problem could create multiple "dead" threads in the server.
- The search of LPR records with advanced AND and OR filters, when applied, was ignoring the date and time filter
- The server could randomly lose licenses due to an error when reading its MAC address
- The bookmark search was repeating the results of records from multiple cameras
- Texts on maps would not be properly displayed when the map object was initially loaded on screen
- Fixed a small problem in HTTP audio output drivers that could lead the system to send plain PCM audio instead of encoded.
- Fixed a multi-thread deadlock issue in the relay system that could cause a total crash of the server.
- Fixed small translation issues
- The system could not read the parameters of an URL without sub-paths. Example:
`http://10.1.1.1:8055?parameter1=value1`
- Fixed a problem in media playback using DGF-KB1000 keyboard that would show an "Invalid time" message during the selection of time range
- Some objects in the map would be deactivated after update to version 7.1
- Under I/O device registration, after adding a new output action script it was required to close the registration screen and open it again so the action would be available for selection on events of the same device
- After minimizing the Surveillance Client, the list of views (from objects list) could vanish
- The saved position of panomorph or fisheye cameras in surveillance views was not being loaded when these views were loaded from inside a timer view
- Fixed a problem that could hang the media playback when playing backwards
- The archiving system would not delete some empty old folders
- Fixed a problem that could cause crash the server during load in case the I/O of a camera was activated and an event with action to send e-mail with images from the camera was triggered
- The status of I/O device ports in Administration Client was starting with 0 instead of 1
- In maps registration, a warning message will be displayed in case the server is not licensed. In some cases this alert message could be hidden behind the editor screen.
- Fixed a problem that was preventing the printing of any report from Surveillance Client in Standard and Explorer editions
- Fixed a problem in ONVIF communication driver that would keep a camera not working after a connection break
- Zoom commands for dewarped images of Vivotek fisheye cameras was not working
- Digifort HTTPS server was not working due to SSLv3 authentication. The authentication method was changed to TLS1.2
- During the download of data from recognized license plates in LPR search in Surveillance Client, the screen was not being properly updated
- Fixed a problem in LG communication drivers that could cause a server crash in case multiple cameras using this driver were not working
- Old Pelco models were no long working in version 7.1

- The editor of audio groups in Surveillance Client was removing old items from the list when new items were being added
- When a camera was deleted from the system through Administration Client, this could cause a negative effect in Surveillance Client in case this camera was being watched, possibly causing the crash of the Surveillance Client
- Upon saving user groups in Administration Client, the maps with rights over the group were not being live-updated
- Fixed a problem with dewarping of Samsung fisheye cameras
- Fixed a problem in the RTSP parser that could lose transmission sync if the camera sent the control character "\$" in a session ID
- Fixed a minor ONVIF compatibility issue with Axis cameras
- When exporting JPEG images in Surveillance Client of live or recorded cameras the system will now export to the correct file size
- When thousands of cameras (about 1500) are configured on a single server, the status of cameras above 1500 was not being updated on the Surveillance Client
- Fixed a problem in the RTSP server and RTSP drivers connecting to Digifort server that made it impossible to use media profiles with accented characters
- When the system sent an e-mail in the restore of communication with an equipment, the customized message configured in the event was not sent in the body of the e-mail
- The list of Surveillance Client objects did not allow double-clicking on views with the same name from different layouts (when set to display all views regardless of layout)
- Fixed an issue that could remove the privacy mask when close the camera in the privacy mask setting if the image was not yet displayed
- Fixed a problem that could corrupt unencrypted files after an encrypted exporting
- Fixed a problem of integration with Google Maps that could display script errors
- Fixed an issue with Verint communication drivers that was not doing the interlacing of 4CIF images
- Fixed an issue with positioning of multi-monitors when using full screen mode with multi-monitor in manual mode
